PROFESSIONAL SUMMARY

Fullstack developer with a background as a certified prosthetist orthotist. After four years in healthcare I moved into tech through a 2-year fullstack .NET programme at Chas Academy, and now work as a developer at ITRL (KTH) in Stockholm. I like building things people actually use, and work best when I can take a feature end to end, from database to frontend, because I like understanding the whole system I am building. My healthcare background gave me a structured way of working, patience under pressure and comfort in environments where confidentiality and safety matter. Comfortable communicating with both developers and non-technical stakeholders and I work well in a team.

TECHNICAL SKILLS

Languages: C#, Python, JavaScript, TypeScript, SQL, HTML, CSS, Bash

Backend: ASP.NET Core (MVC & Web API), .NET 8/9/10, Entity Framework Core (EF Core), FastAPI, JWT Authentication, WebSocket

DevOps & Infrastructure: Docker, Docker Compose, Git, GitHub, Linux, microservice architecture

Frontend: React, Tailwind CSS, DaisyUI, Bootstrap, React Leaflet, Vite, Node.js, npm, Razor

Databases & Cloud: SQL Server, PostgreSQL, Supabase, Azure SQL Database, Azure App Service, Azure OpenAI (GPT-4o), Vercel

Tools: Visual Studio 2022/2026, Visual Studio Code, SSMS, Postman, Swagger / OpenAPI, GitHub Actions (CI/CD), Figma

Practices: Agile, RESTful API design, MVC, CI/CD, code versioning, WCAG

Productivity: Google Workspace, GitHub Projects, Notion, Trello

WORK EXPERIENCE

Fullstack Developer, ITRL Integrated Transport Research Lab, Stockholm

Jan 2026 - current

- Built a fullstack web simulation to visualise 5G network cell planning and resource allocation for autonomous vehicles.
 - Developed React/TypeScript frontend with interactive map-based area selection, as well as manual input of coordinates. Shows the vehicle and base stations (cell towers) on the map with markers and clustering when zoomed out.
 - Designed and built an ASP.NET Core Web API to fetch cell tower data from a Supabase/PostgreSQL database populated with OpenCellID open data, and a Python/FastAPI microservice orchestrating end-to-end SUMO traffic simulations streamed via WebSocket.
 - Built and maintained a multi-service platform (React frontend, .NET API, Python/SUMO microservice) with Docker Compose to support ongoing traffic and network research.
- Collaborated closely with researchers and a multidisciplinary team, adapting the platform based on feedback and evolving research needs.

Certified Prosthetist Orthotist, Ottobock Care (formerly Aktiv Ortopedteknik), Uppsala

2022 - 2026

- Specialised in orthotic footwear and insoles for diabetic and rheumatic patients, with the aim of improving quality of life through pain relief or preventing pressure ulcers.
- Clinical assessment of each patient's physical condition informed the individually adapted fabrication and fitting of aids, to counter incorrect biomechanical loading or maintain existing physical function.

PROJECTS

Slice-T: V2X Network Simulation Platform

React · TypeScript · Vite · React Leaflet · .NET 8 · ASP.NET Core · Entity Framework Core · FastAPI · Python · SUMO · WebSocket · PostgreSQL · Supabase · Docker · Docker Compose

- A fullstack V2X (Vehicle-to-Everything) simulation platform modelling V2N behaviour across Sweden, visualising research on the importance of resource allocation for cell planning to ensure network stability for autonomous

vehicles.

- Backend: Built REST API endpoints via ASP.NET Core to filter and fetch tower data from a published database (Supabase, data from OpenCellID), and a Python/FastAPI microservice to handle vehicle simulations in a selected area, with WebSocket streaming to the frontend.
- Frontend: React/TypeScript with an interactive map and area filter using React Leaflet; shows vehicles and base stations with markers and clustering when zoomed out.
- Configured Dockerfiles and Docker Compose for a stable multi-service environment.

RecipeSnap: Recipe Unit Converter Web Application

ASP.NET Core Web API · .NET 10 · C# · React 19 · TypeScript · Tailwind CSS · DaisyUI · OCR.space API · UnitsNet

- Fullstack web app that converts recipe units from an image automatically, saving manual one-by-one conversion across metric and imperial systems, faster and less AI-token heavy than using a chatbot.
- A stateless web application using third-party OCR to extract text from recipe images, filter measurement values, and convert across three categories: weight, volume, and temperature.
- Backend: OCR.space API for text extraction, regex for filtering, and UnitsNet to identify and convert units across categories.
- Frontend: React/TypeScript with a metric/imperial toggle; users upload a recipe image and receive a list of converted values alongside the original.
- Deployed backend via Azure and frontend via Vercel.

J3M: Meal Planning Web Application

ASP.NET Core Web API · .NET 9 · C# 13 · Entity Framework Core · SQL Server · Azure SQL Database · Azure App Service · JWT · Bootstrap · Razor MVC · Azure OpenAI GPT-4o

github.com/MJ-esy/J3m_BE · github.com/MJ-esy/J3M_Frontend

- Group project (4 developers). Fullstack web app that suggests recipes based on fridge ingredients, aiming to reduce food waste and assist meal planning through AI-powered weekly meal plans with shopping lists.
- Users can browse recipes filtered by dietary preference (keto, vegan, pescetarian, paleo, vegetarian) and receive AI-generated weekly meal plans via Azure OpenAI (GPT-4o).
- Backend: Designed the relational database schema; built repository and service layers, including REST API endpoints in ASP.NET Core.
- Frontend: Designed in Figma following WCAG accessibility guidelines (contrast, alt text, font style). Built using Razor following MVC structure.
- Integrated Azure OpenAI for AI-powered meal planning; deployed full stack and set up CI/CD pipeline via Azure.

Equilog: Horse Stable Management Application

React.js · JavaScript · Tailwind CSS · HTML · CSS · SQL · Axios

Chas Challenge 2025, Winner: Entrepreneur, Best UX & Student's Choice

- Built responsive frontend components with React.js and Tailwind CSS covering a shared calendar, member management and horse profiles, applying WCAG guidelines and using Figma for design and planning.
- Collaborated in a multidisciplinary team with fullstack developers, UX/UI and DevOps students from different programs, giving a holistic perspective on how different roles and competencies contribute to a finished software product.
- Won three awards at Chas Challenge 2025 (Entrepreneur, Best UX and Student's Choice) across a field of competing teams.

EDUCATION

Fullstack .NET Development, Higher Vocational Education · Chas Academy · 2024 – 2026

Prosthetics and Orthotics, BSc · School of Health Sciences, Jönköping University · 2019 – 2022

International Baccalaureate, Natural Sciences · S:t Eskils Gymnasium · 2015 – 2018

LANGUAGES

English (Fluent) · Swedish (Fluent) · Mandarin / Chinese (Fluent)

ADDITIONAL

Forum Jämställdhet, Volunteer (2020) · First Aid Certificate, Svenska Röda Korset (2021)
